

PRESCRIBING INFORMATION
For the Use Only of a Registered Medical Practitioner

CILANEM 500 mg

(Imipenem and Cilastatin for Injection USP)

To reduce the development of drug-resistant bacteria and maintain the effectiveness of Imipenem and Cilastatin and other antibacterial drugs, CILANEM 500 mg (Imipenem and Cilastatin Injection) should be used only to treat or prevent infections that are proven or strongly suspected to be caused by bacteria.

For Intravenous Injection Only.

COMPOSITION

Active ingredients

CILANEM 500 mg

Each vial contains:

Imipenem USP (Sterile) equivalent to anhydrous imipenem 500 mg

Cilastatin Sodium USP (Sterile) equivalent to cilastatin 500 mg

Excipients: Sodium bicarbonate USP (Sterile) added as buffer

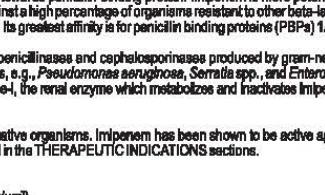

PHARMACEUTICAL FORM AND CONTENTS

Injection for intravenous use

THERAPEUTIC CLASS / ACTIVITY¹

CILANEM 500 mg is a sterile formulation of imipenem (a beta-lactam antibiotic) and cilastatin sodium (the inhibitor of the renal dipeptidase, dehydropeptidase I), with sodium bicarbonate added as a buffer. Imipenem and cilastatin combination is a potent broad spectrum antibacterial for intravenous administration.

Imipenem (N-formimidoylthienamycin monohydrate) is a crystal derivative of thienamycin, which is produced by *Streptomyces catleyi*. Its chemical name is (5R,6S)-3-[2-(formimidoylamino)ethyl]thio-6-[(R)-1-hydroxyethyl]-7-oxo-1-azabicyclo[3.2.0]hept-2-one-2-carboxylic acid monohydrate. It has a molecular weight of 317.37. Its empirical formula is C₈H₁₁N₂O₄S·H₂O. Its structural formula is given below:

Cilastatin sodium is the sodium salt of a derivatized heptenoic acid. It is chemically designated as sodium (Z)-7[(R)-2-amino-2-carboxyethyl]thio-2-(S)-2,2-dimethylcyclopropanecarboxamido-2-heptenoate. It has a molecular weight of 380.43. Its empirical formula is C₁₀H₁₆N₂O₅Na. Its structural formula is given below:

Mechanism of Action

Imipenem is a potent inhibitor of bacterial cell wall synthesis and is highly reactive towards penicillin-binding protein. Imipenem is more potent in its bactericidal effect than other antibiotics studied. Imipenem also provides excellent stability to degradative bacterial beta-lactamases. Imipenem is therefore active against a high percentage of organisms resistant to other beta-lactam antibiotics.

The bactericidal activity of imipenem results from the inhibition of cell wall synthesis. Its greatest affinity is for penicillin binding proteins (PBPs) 1A, 1B, 2, 4, 5 and 6 of *Escherichia coli*, and 1A, 1B, 2, 4 and 5 of *Pseudomonas aeruginosa*.

The lethal effect is related to binding to PBP 2 and PBP 1B.

Imipenem has a high degree of stability in the presence of beta-lactamases, both penicillinas and cephalosporinas produced by gram-negative and gram-positive bacteria. It is a potent inhibitor of beta-lactamases from certain gram-negative bacteria which are inherently resistant to most beta-lactam antibiotics, e.g., *Pseudomonas aeruginosa*, *Enterobacter* spp., and *Enterococcus* spp.

Cilastatin sodium is a competitive, reversible, and specific inhibitor of dehydropeptidase-I, the renal enzyme which metabolizes and inactivates imipenem. Cilastatin sodium is devoid of intrinsic antibacterial activity itself and does not affect the antibacterial activity of imipenem.

Antimicrobial Activity

Imipenem has *in vitro* activity against a wide range of gram-positive and gram-negative organisms. Imipenem has been shown to be active against most strains of the following microorganisms, both *in vitro* and in clinical infections treated with the intravenous formulation of imipenem-cilastatin sodium as described in the THERAPEUTIC INDICATIONS sections.

Gram-positive aerobes:

Enterococcus faecalis (formerly *S. faecalis*)

(NOTE: Imipenem is inactive *in vitro* against *Enterococcus faecium* [formerly *S. faecium*])

Staphylococcus aureus including penicillinase-producing strains

Staphylococcus epidermidis including penicillinase-producing strains

(NOTE: Methicillin-resistant *staphylococcus* should be reported as resistant to Imipenem)

Streptococcus pneumoniae

Streptococcus pyogenes

Gram-negative aerobes:

Aerobacter spp.

Enterobacter spp.

Enterobacteriaceae

Haemophilus influenzae

Morganella morganii

Proteus vulgaris

Providencia rettgeri

(NOTE: Imipenem is inactive *in vitro* against *Xanthomonas (Pseudomonas) malophilia* and some strains of *P. cepacia*)

Serratia spp., including *S. marcescens*

Gram-positive anaerobes:

Bacillus spp.

Clostridium spp.

Peptococcus spp.

Peptostreptococcus spp.

Gram-negative anaerobes:

Bacteroides spp., including *B. fragilis*

Fusobacterium spp.

The following *in vitro* data are available, but their clinical significance is unknown.

Imipenem exhibits *in vitro* minimum inhibitory concentrations (MICs) of 4 µg/ml. or less against most ($\geq 80\%$) strains of the following microorganisms; however, the safety and effectiveness of Imipenem in treating clinical infections due to these microorganisms have not been established in adequate and well controlled clinical trials.

Gram-positive aerobes:

Bacillus spp.

Micrococcus spp.

Group C streptococci

Viridans group streptococci

Gram-negative aerobes:

Aeromonas hydrophila

Capnocytophaga spp.

Neisseria gonorrhoeae including penicillinase-producing strains

Proteobacteria

Haemophilus influenzae

Klebsiella spp.

Proteus vulgaris

Providencia rettgeri

Pseudomonas aeruginosa

Serratia spp.

Stenotrophomonas maltophilia

Yersinia enterocolitica

Yersinia pseudotuberculosis

Yersinia spp.

Zymomonas spp.

Zooglea spp.

Zymomonas spp.

THIS IS A MEDICAMENT	
Medicament is a product which affects your health and its consumption contrary to instructions is dangerous for you. Follow strictly the doctor's prescription, the method of use and the instructions of the pharmacist who sold the medicament.	
The doctor and the pharmacist are the experts in medicines, their benefit and risks. Do not by yourself interrupt the period of treatment prescribed. Do not repeat the same prescription without consulting your doctor. Keep all medicines out of reach of children.	
Council of Arab Health Ministers, Union of Arab Pharmacists.	

DOSAGE AND ADMINISTRATION¹⁴

CILANEM 500 mg (Imipenem and Cilastatin Injection) is for intravenous use only and it should not be used intramuscularly.

Adults: The dosage recommendations for CILANEM 500 mg (Imipenem and Cilastatin Injection) represent the quantity of Imipenem to be administered. An equivalent amount of cilastatin is also present in the solution. Each 125 mg, 250 mg, or 500 mg dose should be given by intravenous administration over 20 to 30 minutes. Each 750 mg or 1000 mg dose should be infused over 40 to 60 minutes. In patients who develop nausea during the infusion, the rate of infusion may be slowed.

The total daily dosage for intravenous Imipenem-cilastatin should be based on the type or severity of infection and given in equally divided doses based on consideration of degree of susceptibility of the pathogen(s), renal function, and body weight. Adult patients with impaired renal function, as judged by creatinine clearance $\leq 70 \text{ mL/min}/1.73 \text{ m}^2$, require adjustment of dosage as described below.

Intravenous Dosage Schedule for Adults with Normal Renal Function and Body Weight 70 kg

Doses cited in Table 1 below are based on a patient with normal renal function and a body weight of 70 kg. These doses should be used for a patient with a creatinine clearance of $\geq 71 \text{ mL/min}/1.73 \text{ m}^2$ and a body weight of $\geq 70 \text{ kg}$. A reduction in dose must be made for a patient with a creatinine clearance of $\leq 70 \text{ mL/min}/1.73 \text{ m}^2$ and/or a body weight less than 70 kg.

Dosage regimens in column A of Table 1 below are recommended for infections caused by fully susceptible organisms which represent the majority of pathogenic species. Dosage regimens in column B of Table 1 are recommended for infections caused by organisms with moderate susceptibility to Imipenem, primarily some strains of *P. aeruginosa*.

Table 1: Intravenous dosage schedule for adults with normal renal function (creatinine clearance of $\geq 71 \text{ mL/min}/1.73 \text{ m}^2$) and body weight 70 kg.

Type or Severity of Infection	A		B	
	Fully susceptible organisms including gram-positive and gram-negative aerobes and anaerobes	Moderately susceptible organisms, primarily some strains of <i>P. aeruginosa</i>	Fully susceptible organisms including gram-positive and gram-negative aerobes and anaerobes	Moderately susceptible organisms, primarily some strains of <i>P. aeruginosa</i>
Mild	250 mg q8h (Total Daily Dose = 1.0g)	600 mg q8h (Total Daily Dose = 2.0g)	250 mg q8h (Total Daily Dose = 1.0g)	600 mg q8h (Total Daily Dose = 2.0g)
Moderate	600 mg q8h (Total Daily Dose = 1.5g) or 500 mg q8h (Total Daily Dose = 2.0g)	600 mg q8h or 1 g q8h (Total Daily Dose = 3.0g)	600 mg q8h (Total Daily Dose = 2.0g)	600 mg q8h or 1 g q8h (Total Daily Dose = 4.0g)
Severe, life threatening only	500 mg q8h (Total Daily Dose = 2.0g)	1 g q8h (Total Daily Dose = 3.0g) or 1 g q8h (Total Daily Dose = 4.0g)	500 mg q8h (Total Daily Dose = 2.0g)	1 g q8h (Total Daily Dose = 3.0g) or 1 g q8h (Total Daily Dose = 4.0g)
Uncomplicated urinary tract infection	250 mg q8h (Total Daily Dose = 1.0g)	250 mg q8h (Total Daily Dose = 1.0g)	250 mg q8h (Total Daily Dose = 1.0g)	250 mg q8h (Total Daily Dose = 1.0g)
Complicated urinary tract infection	600 mg q8h (Total Daily Dose = 2.0g)	600 mg q8h (Total Daily Dose = 2.0g)	600 mg q8h (Total Daily Dose = 2.0g)	600 mg q8h (Total Daily Dose = 2.0g)

Due to the high antimicrobial activity of intravenous Imipenem-cilastatin, it is recommended that the maximum total daily dosage not exceed 50 mg/kg/day or 4.0 g/day, whichever is lower. There is no evidence that higher doses provide greater efficacy. However, patients over twelve years of age with cystic fibrosis and normal renal function have been treated with intravenous Imipenem-cilastatin at doses up to 90 mg/kg/day in divided doses, not exceeding 4.0 g/day.

Reduced Intravenous Schedule for Adults with Impaired Renal Function and/or Body Weight <70 kg

Patients with creatinine clearance of $\leq 70 \text{ mL/min}/1.73 \text{ m}^2$ and/or body weight less than 70 kg require dosage reduction of CILANEM 500 mg (Imipenem and Cilastatin Injection) as indicated in the tables below. Creatinine clearance may be calculated from serum creatinine concentration by the following equation:

$$T_c (\text{Male}) = \frac{(\text{Age in years})}{(72)} \times \text{Creatinine in mg/dL}$$

$$T_c (\text{Female}) = 0.65 \times \text{above value}$$

To determine the dose for adults with impaired renal function and/or reduced body weight:

1. Choose a total daily dose from Table 1 above based on infection characteristics.

2. a) If the total daily dose is 1.0 g, 1.5 g, or 2.0 g, use the appropriate subsection of Table 2 below and continue with step 3.

b) If the total daily dose is 3.0 g or 4.0 g, use the appropriate subsection of Table 3 and continue with step 3.

3. From Table 2 or 3:

a) Select the body weight on the far left which is closest to the patient's body weight (kg).

b) Select the patient's creatinine clearance category.

c) Where the row and column intersect is the reduced dosage regimen.

Table 2: Reduced intravenous dosage of intravenous Imipenem-cilastatin in adult patients with impaired renal function (creatinine clearance $\leq 70 \text{ mL/min}/1.73 \text{ m}^2$) and/or body weight <70 kg.

And Body Weight (kg) is:	If Total Daily Dose from Table 1 is:		
	1.0 g/day		1.5 g/day
	and creatinine clearance ($\text{mL/min}/1.73 \text{ m}^2$) is:	and creatinine clearance ($\text{mL/min}/1.73 \text{ m}^2$) is:	and creatinine clearance ($\text{mL/min}/1.73 \text{ m}^2$) is:
then the reduced dosage regimen (mg) is:			
≥ 70	250 q8h q12h q12h	500 q8h q12h q12h	750 q8h q12h q12h
60	250 q8h q12h q12h	500 q8h q12h q12h	750 q8h q12h q12h
50	125 q8h q12h q12h	250 q8h q12h q12h	375 q8h q12h q12h
40	125 q8h q12h q12h	250 q8h q12h q12h	375 q8h q12h q12h
30	125 q8h q12h q12h	250 q8h q12h q12h	375 q8h q12h q12h

Table 3: Reduced intravenous dosage of intravenous Imipenem-cilastatin in adult patients with impaired renal function (creatinine clearance $\leq 70 \text{ mL/min}/1.73 \text{ m}^2$) and/or body weight <70 kg.

And Body Weight (kg) is:	If Total Daily Dose from Table 1 is:		
	3.0 g/day		4.0 g/day
	and creatinine clearance ($\text{mL/min}/1.73 \text{ m}^2$) is:	and creatinine clearance ($\text{mL/min}/1.73 \text{ m}^2$) is:	
then the reduced dosage regimen (mg) is:			
≥ 70	1000 q8h q12h q12h	1500 q8h q12h q12h	1000 q8h q12h q12h
60	750 q8h q12h q12h	1125 q8h q12h q12h	750 q8h q12h q12h
50	500 q8h q12h q12h	750 q8h q12h q12h	500 q8h q12h q12h
40	400 q8h q12h q12h	600 q8h q12h q12h	400 q8h q12h q12h
30	250 q8h q12h q12h	375 q8h q12h q12h	250 q8h q12h q12h

Patients with creatinine clearances of 6 to $20 \text{ mL/min}/1.73 \text{ m}^2$ should be treated with intravenous Imipenem-cilastatin 125 mg or 250 mg every 12 hours for most pathogens. There may be an increased risk of seizures when doses of 500 mg every 12 hours are administered to these patients.

Patients with creatinine clearance $\leq 5 \text{ mL/min}/1.73 \text{ m}^2$ should not receive intravenous Imipenem-cilastatin unless hemodialysis is instituted within 48 hours. There is inadequate information to recommend usage of intravenous Imipenem-cilastatin for patients undergoing peritoneal dialysis.

Hemodialysis: When treating patients with creatinine clearances of $\leq 5 \text{ mL/min}/1.73 \text{ m}^2$ who are undergoing hemodialysis, use the dosage recommendations for patients with creatinine clearances of 6 to $20 \text{ mL/min}/1.73 \text{ m}^2$ (See Reduced Intravenous Dosage Schedule for Adults with Impaired Renal Function and/or Body Weight <70 kg). Both Imipenem and cilastatin are cleared from the circulation during hemodialysis. The patient should receive intravenous Imipenem-cilastatin after hemodialysis and at 12 hour intervals timed from the end of the hemodialysis session. Dialysis patients, especially those with background CNS disease, should be carefully monitored; for patients on hemodialysis, intravenous Imipenem-cilastatin is recommended only when the benefit outweighs the potential risk of seizures (see PRECAUTIONS).

Prophylactic Use: For prophylaxis against post-surgical infections in adults, 1 gram of Imipenem-Cilastatin injection should be given intravenously on induction of anesthesia and 1 gram three hours later. For high-risk (i.e. colorectal) surgery, two additional 0.5 gram doses can be given at 8 and 16 hours after induction.

Preparations

(See PRECAUTIONS: Pediatric patients)

For pediatric patients ≥ 3 months of age, the recommended dose for non-CNS infections is 15 to 25 mg/kg/day administered every six hours. Based on studies in adults, the maximum daily dose for treatment of infections with fully susceptible organisms is 2.0 g per day, and of infections with moderately susceptible organisms (primarily some strains of *P. aeruginosa*) is 4.0 g/day. Higher doses (up to 90 mg/kg/day in older children) have been used in patients with cystic fibrosis.

For pediatric patients ≤ 3 months of age (weighing $\geq 1,500$ grams), the following dosage schedule is recommended for non-CNS infections:

<1 week of age: 25 mg/kg every 12 hrs

1 to 4 weeks of age: 25 mg/kg every 8 hrs

4 weeks to 3 months of age: 25 mg/kg every 6 hrs.

Doses less than or equal to 500 mg should be given by intravenous infusion over 40 to 60 minutes.

Intravenous CILANEM 500 mg (Imipenem and Cilastatin Injection) is not recommended in pediatric patients with meningitis or CNS infections because of the risk of seizures. If meningitis is suspected, then other appropriate antibiotic should be used.

Intravenous CILANEM 500 mg (Imipenem and Cilastatin Injection) is not recommended in paediatric patients <30 kg with impaired renal function, as no data are available.

Use in the elderly: Age does not usually affect the tolerability and efficacy of Imipenem and Cilastatin injection. The dosage should be determined by the severity of the infection, the susceptibility of the causative organism(s), the patient's clinical condition, and renal function.

Preparation of Solution

Vials: Contents of the vials must be suspended and transferred to 100 mL of an appropriate compatible infusion solution.

A suggested procedure is to add approximately 10 mL from the appropriate compatible infusion solution (see list of diluents under Stability and Compatibility below) to the vial. Shake well and transfer the resulting suspension to the compatible infusion solution container.

CAUTION: THE SUSPENSION IS NOT DIRECT INFUSION.

Reconstitute with an additional 10 mL of compatible infusion solution to ensure complete transfer of vial contents to the compatible infusion solution. The resulting mixture should be agitated until clear. Benzyl alcohol has been associated with toxicity in neonates. While toxicity has not been demonstrated in pediatric patients greater than three months of age, small pediatric patients in this age range may also be at risk for benzyl alcohol toxicity. Therefore, diluents containing benzyl alcohol should not be used when CILANEM 500 mg (Imipenem and Cilastatin Injection) is constituted for administration to pediatric patients in this age range.

Compatibility and Stability

Before reconstitution, the dry powder should be stored at a temperature below 25°C (77°F).

Reconstituted solutions of CILANEM 500 mg (Imipenem and Cilastatin Injection) range from colorless to yellow. Variations of color within this range do not affect the potency of the product.

In keeping with good clinical and pharmaceutical practice, CILANEM 500 mg (Imipenem and Cilastatin Injection) should be administered as a freshly prepared solution. CILANEM 500 mg (Imipenem and Cilastatin Injection) as supplied in single use vials and reconstituted with the below given diluents (see Preparation of Solution above), maintains satisfactory potency for 4 hours at room temperature or for 24 hours under refrigeration (4°C). Solutions of CILANEM 500 mg (Imipenem and Cilastatin Injection) should not be frozen.

5% Sodium Chloride Injection
